

Exploratory Data Analysis on Tips Dataset - Overall Findings

1. Gender Distribution:

- More male customers were recorded compared to female customers.

2. Smoking Behavior:

- Non-smokers were more frequent than smokers in the dataset.

3. Day-wise Distribution:

- Most data entries were on weekends, especially Saturday, which also showed the highest total tips.

4. Total Bill and Tip Insights:

- Male customers had slightly higher average bills and tips than female customers.
- A clear positive correlation exists between total bill and tip.

5. Size of Party:

- Larger groups tend to generate higher total bills and slightly higher tips.
- Most dining groups were of size 2 or 3.

6. Daywise Tipping Behavior:

- Saturday saw the highest overall tipping followed by Sunday.
- Friday received the lowest tips.

7. Tip Distribution:

- Most tips range between \$2 and \$4.

- There are a few high-value tip outliers.

8. Total Bill Distribution:

- Majority of total bills fall in the \$10-\$20 range.
- The distribution shows a right skew, with few large bills.

9. Correlations:

- Tip is strongly correlated with total bill.
- Size has a weak positive relationship with both tip and total bill.

10. General Observations:

- Lunch and Dinner times vary in tipping patterns, but this was not deeply analyzed.
- Weekends tend to have higher spending and tipping activity.
